MUKHTSAR
STUDY

Carousel Pipeline

Operator guide

EVERY SESSION STARTS HERE

```
cd C:\Users\Mzx\mukhtsar-study
.venv\Scripts\Activate.ps1
```

Your prompt must show `(.venv)`. Without it you are running a second, separate set of packages — it works until something upgrades globally, and then renders change for no visible reason.

MAKE AND SCHEDULE A POST

```
python -m src.run go
```

1. Pick a number	Already written = build now. Fresh = write it first. News items appear at the top.
2. Slides	4 to 7. The cover and closing card are two of them.
3. Design	A = dark navy · B = light cream. Roughly 2 A to every 1 B keeps the grid rhythm.
4. With images	Y searches Pexels per slide · N is text only, faster and free.
5. Read the slides	The folder opens by itself. **This is the only review there is.**
6. Enter	Takes the next free slot, marks it read, pushes the images.

THE OTHER COMMANDS

`schedule`	Show the queue
`schedule --cancel <id>`	Drop one entry
`build --topic <id>`	Rebuild without writing
`status`	Counts and quota
`publish-due`	Post anything overdue now
`sources --check`	Test the news feeds
`tools.selftest`	55 checks, run after edits

WHAT RUNS WITHOUT YOU

1. **Publishing.** GitHub Actions checks the queue on a cron and posts anything past its slot. Your machine can be off.
2. **Pushing.** Scheduling commits and pushes the images.
3. **Timing is approximate.** GitHub throttles free scheduled runs — expect up to ~3 hours late.

WHAT THE PIPELINE CHECKS, AND WHAT IT CANNOT

Automatic

1. No phone number, on slides or in captions
2. Canvas 1080×1350, under 8 MB, 3–10 slides
3. No unfilled photo windows, footer clearance
4. Photos: no people, no foreign countries, no alcohol
5. A vision model looks at each photo and rejects uncovered hair, identifiable faces, revealing clothing
6. Generated copy carries no figures at all
7. New topics are checked against everything published

Only you

1. Whether a claim is *true*. Wrong process claims read exactly like right ones and carry no number to flag.
2. Whether a photo, though clean, is *relevant* — a wax-sealed letter passed every filter.
3. Whether the Arabic sounds like Mukhtsar.
4. Visa, EMGS, recognition and fees: write these by hand from the source. Their being wrong costs the most.

Before a build can publish, its images must be in the repo. Scheduling pushes them for you. If you rebuild afterwards, push again — `git add -A; git commit -m "rebuild"; git push` — or Instagram fetches a 404 at 2 AM. `schedule` flags any queued post whose folder is missing.

WHEN SOMETHING BREAKS

`font error: ... missing`	`python -m tools.setup_assets` then `python -m tools.make_logo`
`cannot load libgobject`	GTK3 runtime missing, or PATH not picked up — reopen PowerShell
`returns 404 — not published yet`	Commit and push the build
`No photo passed the image check`	Build text-only, or edit that slide's query in `content/topics.yaml`
`generation error: quota`	Gemini limit — wait, or write the topic by hand
`Build failed`	The folder deletes itself. Nothing half-finished is left behind.

Files that matter. `content/ideas.yaml` topic backlog, edit freely · `content/topics.yaml` written topics · `content/schedule.json` the queue · `config/settings.yaml` schedule, photo filters, models · `.env` keys — never commit, carry it across any folder move. **Standing rules:** no phone number · only consultancy is free · no emoji on slides · never mislabel a location · verify every factual claim.
